

LET'S GET STARTED

Open the box and carefully unwrap all components. Check for any damaged parts. If any part has become damaged in shipping, notify your retailer within 5 days of delivery. Please have part number(s) ready to insure proper replacement.

We suggest keeping the box that your water unit comes to be re-used when traveling with or transporting your filtration unit.

ASSEMBLY OF YOUR WATER FILTRATION UNIT

1. Soak the #7 Mineral Filter Cartridge in cold tap water for 15 minutes.
2. Hand-wash the Lid, Top Chamber, Plastic Plate, Bottom Chamber and Cover with a mild soap. Your filtration components are not dishwasher safe.
3. To flush the #7 Mineral Filter Cartridge, hold it upright under cold running tap water. Do this for about 15 seconds.
4. Allow excess water to drain from the Mineral Filter Cartridge.
5. Insert the #3 O-Ring into the nozzle of the #2 Ceramic Filter (see diagram to identify components).
6. Insert Ceramic Filter into the #4 Top Chamber and fasten it with the #5 Nut. Do not over-tighten.
7. Twist the #7 Mineral Filter Cartridge counter clockwise into the #6 Plastic Plate.
8. To assemble the #10 Spigot, use the #11 Silicon Ring on the outside and the #12 Silicon Ring on the inside to attach it snugly to the #9 Bottom Chamber. Screw on the #13 Spigot Nut.
9. Stack the sections as they appear in the Diagram.
10. Make sure the unit is on a stable surface so as not to tip.

FILLING UNIT WITH WATER

When working with Adya Clarity minerals, please follow these guidelines:

- As with all concentrated mineral solutions, keep out of reach of children.
- Avoid contact with eyes, surfaces or natural fibers until diluted.

Now you are ready to begin filtering water through your unit:

1. You may either remove the Top Chamber from the unit and fill it at the sink; or you may bring a pitcher of water to the unit and fill the Top Chamber. The Top Chamber is 5 liters and the Bottom Chamber is 10 liters. Do keep in mind how much room is available in the Bottom Chamber. Refilling the Top Chamber can cause overflow in the Bottom Chamber.
2. Once water is added to the Top Chamber, add the appropriate amount of Adya Clarity to the water. The ratio of Adya Clarity to water is 1-2 teaspoons per 5 liters (total amount held in Top Chamber).
3. The water will filter through the Ceramic Filter and the Mineral Filter Cartridge. Since this is a gravity fed system, the more water that is in the Top Chamber, the faster the filtering process occurs. Feel free to add additional water and minerals to the Top Chamber. The Adya Clarity to water ratio is 1-2 teaspoons minerals per 5 liters of water.

The water in your bottom chamber will contain fresh, purified water.

COMPONENT DIAGRAM

MICRO CERAMIC FILTER CARE

Depending on your water source and its contaminants: 1. Your filter will turn light brown to orange 2. A build up on the Ceramic Filter will occur. When the Ceramic Filter flow rate has decreased, it is time to lightly scrub the surface of the filter.

We suggest taking the Top Chamber to the sink. Unscrew the Ceramic Filter from the Top Chamber. While holding the filter under running water, gently rub it with a dedicated sponge, scrub pad or paper towel. Do not use cleaners or detergents.

Vigorous scrubbing will cause accelerated wear on the filter. Your Ceramic Filter will not return to the original white.

The Ceramic Filter typically lasts from one to two years. This time-frame depends on the quality of the water you are filtering and on how you have cared for your filter. Help extend the life of your filter by using water that has been pre-treated with Adya Water in a separate pitcher when filling the Top Chamber.

Replace your Ceramic Filter if;

The filter exterior surface is worn through to the comb section of the filter.

MINERAL FILTER CARTRIDGE CARE

The Mineral Filter Cartridge typically lasts 300 gallons. Please consider your daily water usage and calculate when you will need a replacement filter.

It is not unusual for carbon dust to be in your first or second batches of water. The carbon is harmless. For replacement filters, please contact your Adya retailer.

GUIDELINES

Do not over tighten the Nuts when setting the Ceramic Filter.

Do not use water that is micro-biologically unsafe or of unknown quality.

The concentration of indicated substances in water entering the system was reduced to a concentration less than or equal to the permissible limit for water leaving the system as specified in NSF/ANSI 42.

Keep in mind that if you place your unit directly in sunlight, blue green algae may form in the Bottom Chamber. The growth of blue green algae stems from the salts that come from volcanic formations in the form of sulfates. This is absolutely normal and healthy. Clean the tank with a dedicated sponge (no soap). If there is still green left, do not worry, this is not harmful and actually means you have healthy water.

TROUBLESHOOTING

If your spout leaks, check to see that the Washers are on each side of the Spigot of the Bottom Chamber.

If your unit seems to be filtering slowly, please consider the following:

- Because the system is a gravity fed unit, the more water that is in the Top Chamber the faster it will filter. To speed up filtration, keep adding water to the Top Chamber. Do keep in mind how much room is available in the Bottom Chamber. Overfilling the Top Chamber can cause overflow in the Bottom Chamber.
- Consider if it is time to lightly scrub the Ceramic Filter. See guidelines above for Ceramic Filter care.

Adya Clarity

solutions for life

Adya Water Filtration Unit Instructions, Use and Care Manual

CONGRATULATIONS!

You have purchased a practical and effective water filtration unit! This unit is so effective because it combines several of Nature's water purifying processes into a single system. Your unit includes Adya Clarity mineral complex to use in conjunction with a complete set of effective filters: Micro Ceramic Filter and 4-Stage Mineral Filter Cartridge. With this unit, you can make purified, spring-like water in your own home.

IMPORTANT SAFEGUARDS:

Caution: These guidelines and safeguards help ensure that your new filter unit operates effectively. Before installing and using your filter unit, please carefully read all instructions. Always have clean hands when working with your unit. This will help guard against any contamination.
